VISION & LEARNING CENTER

FOR PATIENTS AND FAMILIES
Shared by your rehab team

# Still not right after a stroke or brain injury? Check your vision.

A stroke, a brain injury or a condition like Parkinson's can change how the eyes aim, move and work together, even when the eye chart is normal. These problems are common, measurable and often treatable, and treating them can make the rest of rehab easier.

## Check anything you've noticed

- ☐ Double vision, or closing one eye to see
- ☐ Missing things on one side, like food on the plate
- ☐ Words blur, move or run together
- ☐ Trouble judging distance on steps and curbs
- ☐ Ordinary light is uncomfortable
- ☐ Bumping into things on one side
- ☐ Losing your place or rereading lines
- ☐ Dizzy or unsteady in busy places
- ☐ Reading or screens bring on headaches
- ☐ Worn out by the end of the day

## Don't wait for everything else to clear

Once your doctor has checked you, visual symptoms can be measured and treated alongside the rest of your rehab. Lenses, prism or vision therapy may help. Your care team gets the results, with your permission.
